Explain how the facial adaptations of marine animals help them survive in their aquatic environments.
Marine animals have evolved various facial adaptations, such as streamlined bodies for efficient swimming, sharp teeth for capturing prey, and specialized sensory organs like electroreceptors and lateral lines to detect vibrations and changes in their environment.
Why are facial color patterns important for certain species? Provide examples of animals and their environments.
Facially colored patterns are important for species such as poison dart frogs, which use bright colors to signal toxicity to predators, and mandrills, whose colorful faces are used for social signaling and attracting mates.
Describe the evolutionary significance of the elephant's trunk.

nich
y
5.

Tusks are elongated teeth that are commonly found in certain animals, primarily for defense, digging, or foraging. Notable examples of animals with tusks include elephants, walruses, and wild boars.

What is a distinctive feature of a frog's face?		
<ul><li>Long ears</li><li>Large eyes ✓</li><li>Beak</li><li>Trunk</li></ul>
