Provide a detailed explanation of how limits are used to define continuity at a point.

A function f(x) is continuous at a point c if the following three conditions are met: 1) f(c) is defined, 2) the limit of f(x) as x approaches c exists, and 3) the limit equals f(c), i.e., \(\lim_{x \to c} f(x) = f(c) \).

Which of the following is not a type of discontinuity?

A. Removable
B. Jump
C. Infinite
D. Linear ✓

Discuss the relationship between differentiability and continuity. Can a function be continuous but not differentiable? Provide an example.

Yes, a function can be continuous but not differentiable. An example is f(x) = |x|, which is continuous at all points but has a sharp corner at x = 0, making it non-differentiable there.

Which theorem states that a continuous function on a closed interval takes on every value between its minimum and maximum values?

A. Mean Value Theorem
B. Intermediate Value Theorem ✓
C. Fundamental Theorem of Calculus
D. Extreme Value Theorem

What type of discontinuity occurs when a function has a hole at a point?

A. Jump discontinuity
B. Infinite discontinuity

C. Removable discontinuity ✓

D. Oscillating discontinuity

Which functions have removable discontinuities? (Select all that apply)

A. f(x) = (x^2 - 1)/(x - 1) ✓

B. f(x) = 1/x

C. f(x) = (x^2 - 4)/(x - 2) ✓

D. f(x) = tan(x)

Which of the following is a graphical indicator of continuity at a point?

A. A sharp corner

B. A vertical asymptote

C. A smooth curve with no breaks ✓

D. A cusp

What is the significance of the Intermediate Value Theorem in calculus?

The significance of the Intermediate Value Theorem in calculus is that it guarantees the existence of a solution (or root) for continuous functions within a specified interval.

Which of the following scenarios demonstrate the Intermediate Value Theorem? (Select all that apply)

A. A continuous function crosses the x-axis between two points. ✓

B. A continuous function reaches a maximum value within an interval.

C. A continuous function has a derivative that changes sign.

D. A continuous function takes on every value between two points. ✓

How can you determine if a function has a removable discontinuity? Provide an example.

To determine if a function has a removable discontinuity, check if the limit of the function exists at the point of discontinuity and if it can be defined to match that limit. For example, the function f(x) = (x^2 - 1)/(x - 1) has a removable discontinuity at x = 1, since it can be simplified to f(x) = x + 1 for x ≠ 1, and the limit as x approaches 1 is 2.

Explain the difference between pointwise continuity and uniform continuity.

Pointwise continuity means that for every point in the domain, for every epsilon, there exists a delta such that if the input is within delta of that point, the output is within epsilon of the function's value at that point. Uniform continuity, on the other hand, means that the same delta can be chosen for the entire domain, ensuring that the function behaves continuously in a uniform manner across all points.

Describe a real-world scenario where the concept of continuity is crucial.

In a hospital setting, continuity of care is essential for patients with chronic illnesses, as it ensures that they receive consistent treatment and follow-up, reducing the risk of complications and improving overall health management.

Which of the following statements about continuous functions are true? (Select all that apply)

A. Continuous functions can have sharp corners.
B. Continuous functions cannot have jumps. ✓
C. Continuous functions are always differentiable.
D. Continuous functions have no breaks or holes. ✓

What is the primary condition for a function to be uniformly continuous on an interval?

A. The function is differentiable on the interval.
B. The function is bounded on the interval.
C. The function is continuous on the interval. ✓
D. The function has a constant rate of change on the interval.

Which of the following functions are continuous everywhere? (Select all that apply)

A. f(x) = x^2 + 3x + 2 ✓
B. f(x) = 1/x
C. f(x) = e^x ✓
D. f(x) = sin(x) ✓

Which of the following functions is always continuous?

A. Polynomial functions ✓

B. Rational functions
C. Piecewise functions
D. Trigonometric functions

Which of the following are characteristics of a uniformly continuous function? (Select all that apply)

A. The function is continuous over a closed interval. ✓
B. The function's rate of change is constant.
C. The function does not have any jumps or breaks. ✓
D. The function's continuity does not depend on the interval's size. ✓

What is the definition of continuity at a point for a function?

A. The function has a derivative at that point.
B. The function is defined at that point.
C. The limit of the function as it approaches the point equals the function's value at that point. ✓
D. The function is increasing at that point.

If a function is not continuous at a point, what can we say about the limit at that point?

A. The limit does not exist.
B. The limit exists but does not equal the function's value. ✓
C. The limit equals the function's value.
D. The function is differentiable at that point.

What are necessary conditions for a function to be continuous at a point c? (Select all that apply)

A. f(c) is defined. ✓
B. lim (x -> c) f(x) exists. ✓
C. lim (x -> c) f(x) = f(c) ✓
D. f(x) is differentiable at c.
