Part 1: Building a Foundation

What is the highest point of a wave called?

undefined. A) Trough

undefined. B) Crest ✓

undefined. C) Amplitude

undefined. D) Wavelength

The highest point of a wave is called the crest.

Which of the following are components of a wave? (Select all that apply)

undefined. A) Crest ✓

undefined. B) Frequency ✓

undefined. C) Trough ✓

undefined. D) Period ✓

Components of a wave include crest, frequency, trough, and period.

Define the term "wavelength" in the context of wave anatomy.

Wavelength is the distance between two consecutive crests or troughs in a wave.

List the two main types of waves and provide one example for each.

1. Mechanical Wave Example

Sound wave

2. Electromagnetic Wave Example

Light wave

The two main types of waves are mechanical waves (e.g., sound waves) and electromagnetic waves (e.g., light waves).

What does the frequency of a wave measure?

undefined. A) The height of the wave

undefined. B) The number of waves passing a point per second ✓

undefined. C) The distance between two crests

undefined. D) The speed of the wave

Frequency measures the number of waves passing a point per second.

Part 2: Application and Analysis

If a wave has a frequency of 5 Hz and a wavelength of 2 meters, what is its speed?

undefined. A) 2 m/s

undefined. B) 5 m/s

undefined. C) 10 m/s ✓

undefined. D) 20 m/s

The speed of the wave is 10 m/s.

In which scenarios would you expect wave diffraction to occur? (Select all that apply)

undefined. A) Light passing through a narrow slit ✓

undefined. B) Sound traveling through an open door ✓

undefined. C) A wave hitting a smooth surface and bouncing back

undefined. D) Water waves moving around a small boat ✓

Wave diffraction occurs in scenarios like light passing through a narrow slit and sound traveling through an open door.

Describe a real-world situation where wave interference might be observed and explain its effects.

Wave interference can be observed in situations like noise-cancelation headphones, where sound waves interact to reduce noise.

Which wave behavior is responsible for the bending of light as it passes through a glass prism?

- undefined. A) Reflection
undefined. B) Refraction ✓
undefined. C) Diffraction
undefined. D) Interference

The bending of light as it passes through a glass prism is due to refraction.

Analyze the following scenarios and identify which involve wave reflection. (Select all that apply)

- undefined. A) Echoes heard in a canyon ✓**
undefined. B) A rainbow forming after rain
undefined. C) Light bouncing off a mirror ✓
undefined. D) Water waves spreading out after passing through a gap

Wave reflection occurs in scenarios like echoes heard in a canyon and light bouncing off a mirror.

Compare and contrast mechanical and electromagnetic waves in terms of their properties and mediums of travel.

Mechanical waves require a medium to travel through, while electromagnetic waves can travel through a vacuum.

Part 3: Evaluation and Creation

Which of the following best explains why sound cannot travel through space?

- undefined. A) Space is too cold for sound waves.
undefined. B) Sound waves require a medium to travel through. ✓
undefined. C) Space is too vast for sound waves to reach their destination.
undefined. D) Sound waves are absorbed by cosmic radiation.

Sound cannot travel through space because sound waves require a medium to travel through.

Evaluate the following statements and select those that accurately describe the applications of waves in medical technology. (Select all that apply)

undefined. A) Ultrasound uses sound waves to create images of the inside of the body. ✓

undefined. B) MRI uses electromagnetic waves to produce detailed images of organs and tissues. ✓

undefined. C) X-rays use mechanical waves to view bones.

undefined. D) CT scans use sound waves to detect abnormalities.

Applications of waves in medical technology include ultrasound, MRI, and X-rays.

Design an experiment to demonstrate the principle of wave interference using simple materials. Describe the setup, procedure, and expected outcomes.

An experiment could involve creating waves in water and observing how they interact.
