Part 1: Foundational Knowledge

Which of the following blood types is an example of codominANCE?

undefined. Type A

undefined. Type B

undefined. Type AB ✓

undefined. Type O

Type AB is an example of codominANCE as it expresses both A and B antigens.

Which of the following statements are true about the ABO blood group system? (Select all that apply)

undefined. Type O blood has both A and B antigens.

undefined. Type AB blood has no antibodies in the plasma. ✓

undefined. Type A blood has anti-B antibodies. ✓

undefined. Type B blood has A antigens.

Type AB blood has no antibodies in the plasma, and Type A blood has anti-B antibodies.

Explain what is meant by "codominANCE" in the context of blood types.

CodominANCE occurs when both alleles in a heterozygous individual are fully expressed, resulting in a phenotype that is neither dominant nor recessively masked.

List the alleles involved in determining the ABO blood group system.

1. What are the alleles?

I^A , I^B , i

The alleles involved are I^A , I^B , and i .

What type of antibodies are found in the plasma of a person with blood type O?

undefined. Anti-A only

undefined. Anti-B only

undefined. Both Anti-A and Anti-B ✓

undefined. No antibodies

A person with blood type O has both Anti-A and Anti-B antibodies in their plasma.

Part 2: Understanding Blood Types

If a person has blood type B, which antigens are present on their red blood cells?

undefined. A antigens

undefined. B antigens ✓

undefined. Both A and B antigens

undefined. No antigens

A person with blood type B has B antigens present on their red blood cells.

Which blood types can safely receive blood from a type O donor? (Select all that apply)

undefined. Type A ✓

undefined. Type B ✓

undefined. Type AB ✓

undefined. Type O

Type A, Type B, and Type AB can safely receive blood from a type O donor.

Describe the role of antibodies in blood transfusions and why they are important.

Antibodies play a crucial role in identifying and neutralizing foreign antigens during blood transfusions, preventing adverse reactions.

Part 3: Applying Knowledge

A child has blood type O. Which of the following parental blood type combinations is possible?

undefined. Type A and Type B ✓

undefined. Type AB and Type O

undefined. Type A and Type AB

undefined. Type B and Type AB

A child with blood type O can have parents with blood types A and B, or O and O.

A person with blood type AB is in need of a transfusion. Which blood types can they safely receive? (Select all that apply)

undefined. Type A ✓

undefined. Type B ✓

undefined. Type AB ✓

undefined. Type O ✓

A person with blood type AB can safely receive blood from types A, B, AB, and O.

Given a scenario where a mother is Rh-negative and the father is Rh-positive, explain the potential implications for their child and how it can be managed.

The child may inherit the Rh-positive factor, leading to potential Rh incompatibility, which can be managed with medical interventions during pregnancy.

Which of the following scenarios demonstrates codominANCE in blood types?

undefined. A person with type A blood has children with a person with type B blood, resulting in a child with type O blood.

undefined. A person with type AB blood has children with a person with type O blood, resulting in a child with type A blood.

undefined. A person with type AB blood has children with a person with type B blood, resulting in a child with type AB blood. ✓

undefined. A person with type A blood has children with a person with type A blood, resulting in a child with type A blood.

A person with type AB blood having children with a person with type B blood can produce a child with type AB blood, demonstrating codominANCE.

Analyze the following genetic cross: If both parents are heterozygous for blood type A ($I^A i$), what are the possible blood types of their offspring? (Select all that apply)

undefined. **Type A** ✓

undefined. Type B

undefined. **Type AB** ✓

undefined. **Type O** ✓

The possible blood types of their offspring are Type A, Type O, and Type AB.

Discuss how the concept of codominANCE in blood types can be used to explain genetic diversity in human populations.

CodominANCE contributes to genetic diversity by allowing multiple alleles to be expressed in a population, leading to a variety of phenotypes.

Part 4: Synthesis and Reflection

Which blood type is considered the universal donor, and why?

undefined. Type A

undefined. Type B

undefined. Type AB

undefined. **Type O** ✓

Type O is considered the universal donor because it has no A or B antigens, making it compatible with all blood types.

Evaluate the following statements and select those that accurately describe the relationship between blood types and transfusion compatibility. (Select all that apply)

undefined. Type AB individuals can donate to any blood type.

undefined. Type O individuals can receive blood from any blood type.

undefined. **Type A individuals can receive blood from type O donors.** ✓

undefined. **Type B individuals can donate to type AB recipients.** ✓

Type AB individuals can receive from any blood type, Type O individuals can donate to any blood type, and Type A individuals can receive from type O donors.

Propose a strategy for managing blood supply in a hospital setting, considering the distribution of different blood types and the concept of universal donors and recipients.

A strategy could involve maintaining a balanced inventory of blood types, prioritizing donations from universal donors, and educating the public on the importance of diverse blood donations.

Reflect on the potential ethical considerations involved in using blood type information for purposes beyond medical treatment, such as in forensic investigations or ancestry tracing. List at least two considerations.

1. Consideration 1

Discrimination based on blood type.

2. Consideration 2

Privacy concerns regarding genetic information.

Ethical considerations include the potential for discrimination based on blood type and the privacy concerns surrounding genetic information.
