# Part 1: Building a Foundation

### What is the role of an independent variable in an experiment?

undefined. A) It is the variable that is measured.

undefined. B) It is the variable that is manipulated. ✓

undefined. C) It is the variable that is kept constant.

undefined. D) It is the variable that is ignored.

The independent variable is the variable that is manipulated by the researcher.

## Which of the following are characteristics of a dependent variable? (Select all that apply)

undefined. A) It is manipulated by the researcher.

undefined. B) It is measured in the experiment. ✓

undefined. C) It is affected by the independent variable. ✓

undefined. D) It remains constant throughout the experiment.

The dependent variable is measured and is affected by the independent variable.

# Define a control variable and explain its importance in an experiment.

A control variable is a variable that is kept constant to ensure that the results are due to the independent variable.

#### List two differences between a control group and an experimental group in an experiment.

1. Difference 1

The control group does not receive the treatment.

2. Difference 2

## The experimental group receives the treatment.

The control group does not receive the treatment, while the experimental group does. This allows for comparison.

# Part 2: Comprehension and Application

#### Why is it important to control confounding variables in an experiment?

undefined. A) To increase the number of variables studied.

undefined. B) To ensure the independent variable is the only factor affecting the dependent variable.

✓

undefined. C) To make the experiment more complex.

undefined. D) To reduce the cost of the experiment.

Controlling confounding variables ensures that the independent variable is the only factor affecting the dependent variable.

#### Which of the following statements are true about experimental design? (Select all that apply)

undefined. A) The independent variable is the presumed cause. ✓

undefined. B) The dependent variable is the presumed effect. ✓

undefined. C) Control variables are changed to see their effect.

undefined. D) Confounding variables are intentionally introduced.

The independent variable is the presumed cause, and the dependent variable is the presumed effect.

# Describe a real-world scenario where identifying the independent and dependent variables would be crucial for understanding the outcome.

Identifying the independent and dependent variables helps clarify the relationship and impact of changes in real-world scenarios.

# In a study examining the effect of sunlight on plant growth, what would be the independent variable?

undefined. A) Type of plant

undefined. B) Amount of sunlight ✓

undefined. C) Soil quality

undefined. D) Water frequency

Create hundreds of practice and test experiences based on the latest learning science.

The independent variable is the amount of sunlight, as it is what is being manipulated in the study.

## Part 3: Analysis, Evaluation, and Creation

# Which of the following best describes the relationship between independent and dependent variables?

undefined. A) The independent variable is dependent on the dependent variable.

undefined. B) The dependent variable is manipulated to see its effect on the independent variable.

undefined. C) The independent variable is manipulated to observe its effect on the dependent variable.

undefined. D) Both variables are manipulated simultaneously.

The independent variable is manipulated to observe its effect on the dependent variable.

# In an experiment, if the results show a change in the dependent variable, what could be the possible reasons? (Select all that apply)

undefined. A) The independent variable caused the change. ✓

undefined. B) A confounding variable influenced the results. ✓

undefined. C) The control variables were not properly maintained. ✓

undefined. D) The dependent variable was measured incorrectly. ✓

Possible reasons include the independent variable causing the change, confounding variables influencing results, or measurement errors.

## When evaluating an experiment, which factor is most critical to ensure the results are valid?

The most critical factor is the control of variables to ensure that the results are due to the independent variable.

Propose a simple experiment, including the identification of the independent, dependent, and control variables, and explain how you would ensure the results are reliable.

A simple experiment could involve measuring plant growth with varying sunlight exposure, identifying the independent variable as sunlight, the dependent variable as plant height, and control variables as soil type and water amount.
