Part 1: Building a Foundation

Which of the following is a type of macromolecule?

undefined. Water

undefined. Protein ✓

undefined. Carbon Dioxide

undefined. Oxygen

The correct answer is B) Protein, as it is a type of macromolecule.

Which of the following are considered macromolecules? (Select all that apply)

undefined. Lipids ✓

undefined. Amino Acids

undefined. Carbohydrates ✓

undefined. Nucleic Acids ✓

The correct answers are A) Lipids, C) Carbohydrates, and D) Nucleic Acids.

Describe the primary function of carbohydrates in living organisms.

Carbohydrates primarily provide energy and serve as structural components in cells.

List the four main types of macromolecules and provide one example of each.

1. Carbohydrates

e.g., glucose

2. Proteins

e.g., enzymes

3. Lipids

e.g., triglycerides

4. Nucleic Acids

e.g., DNA

The four main types are: 1) Carbohydrates (e.g., glucose), 2) Proteins (e.g., enzymes), 3) Lipids (e.g., triglycerides), 4) Nucleic Acids (e.g., DNA).

Part 2: Understanding and Interpretation

What is the primary role of nucleic acids in cells?

undefined. Energy storage

undefined. Genetic information storage and transfer ✓

undefined. Structural support

undefined. Catalyzing reactions

The correct answer is B) Genetic information storage and transfer.

Which of the following statements about proteins is true? (Select all that apply)

undefined. They are made of nucleotides.

undefined. They can function as enzymes. ✓

undefined. They are involved in immune response. ✓

undefined. They are a primary energy source.

The correct answers are B) They can function as enzymes and C) They are involved in immune response.

Explain how the structure of phospholipids contributes to their function in cell membranes.

Phospholipids have hydrophilic heads and hydrophobic tails, allowing them to form bilayers that create cell membranes.

Part 3: Application and Analysis

If a cell needs to quickly mobilize energy, which macromolecule is it most likely to use?

undefined. Lipids

undefined. Proteins

undefined. Carbohydrates ✓

undefined. Nucleic Acids

The correct answer is C) Carbohydrates, as they are the quickest source of energy.

Which processes involve the breakdown of macromolecules? (Select all that apply)

undefined. Dehydration synthesis

undefined. Hydrolysis ✓

undefined. Photosynthesis

undefined. Cellular respiration ✓

The correct answers are B) Hydrolysis and D) Cellular respiration.

Describe a real-world scenario where enzymes play a crucial role in a biological process.

Enzymes like amylase in saliva help break down starches into sugars during digestion.

Part 4: Evaluation and Creation

Which level of protein structure is characterized by alpha helices and beta sheets?

undefined. Primary

undefined. Secondary ✓

undefined. tertiary

undefined. Quaternary

The correct answer is B) Secondary.

Analyze the following statements and identify which are true about the polymerization of macromolecules. (Select all that apply)

undefined. It involves the removal of water molecules. ✓

undefined. It requires energy input. ✓

undefined. It is a spontaneous process.

undefined. It results in the formation of monomers.

The correct answers are A) It involves the removal of water molecules and B) It requires energy input.

Compare and contrast the roles of DNA and RNA in genetic information processing.

DNA stores genetic information, while RNA plays a key role in translating that information into proteins.

Which of the following scenarios would most likely disrupt protein function?

undefined. Increase in temperature ✓

undefined. Decrease in light exposure

undefined. Increase in oxygen levels

undefined. Decrease in water availability

The correct answer is A) Increase in temperature, as it can denature proteins.

Evaluate the impact of lipid structure on its function in the following scenarios. (Select all that apply)

undefined. Lipids in cell membranes ✓

undefined. Lipids as hormones ✓

undefined. Lipids in energy storage ✓

undefined. Lipids in photosynthesis

The correct answers are A) Lipids in cell membranes, B) Lipids as hormones, and C) Lipids in energy storage.

Propose a hypothetical experiment to test the effect of temperature on enzyme activity, including your expected outcomes and reasoning.

I would set up an experiment measuring enzyme activity at various temperatures, expecting that activity would increase to an optimal temperature and then decrease at higher temperatures due to denaturation.
