### Part 1: Building a Foundation

---

**What is the range of two-digit numbers?**

undefined. A) 1 to 99

**undefined. B) 10 to 99 ✓**

undefined. C) 10 to 100

undefined. D) 1 to 100

The range of two-digit numbers is from 10 to 99.

**Which of the following are components of a two-digit number? (Select all that apply)**

undefined. A) Hundreds place

**undefined. B) Tens place ✓**

**undefined. C) Units (ones) place ✓**

undefined. D) Thousands place

The components of a two-digit number include the tens place and the units (ones) place.

**Explain the distributive property in the context of multiplying two-digit numbers.**

**The distributive property allows you to multiply a number by breaking it into parts, making calculations easier.**

**Break down the number 47 into its tens and units components.**

1. What is the tens component?

**40**

2. What is the units component?

7

The number 47 can be broken down into 40 (the tens) and 7 (the units).

**What is the first step in multiplying two-digit numbers using the distributive property?**

undefined. A) Add the numbers

**undefined. B) Decompose the numbers into tens and ones ✓**

undefined. C) Estimate the product

undefined. D) Multiply directly

The first step is to decompose the numbers into tens and ones.

## Part 2: comprehension and Application

---

**If you decompose the number 56, what are the tens and units values?**

**undefined. A) 50 and 6 ✓**

undefined. B) 5 and 60

undefined. C) 6 and 50

undefined. D) 56 and 0

The tens and units values of 56 are 50 and 6.

**When multiplying 34 by 56, which of the following partial products would you calculate? (Select all that apply)**

**undefined. A)  $30 * 50$  ✓**

**undefined. B)  $30 * 6$  ✓**

**undefined. C)  $4 * 50$  ✓**

**undefined. D)  $4 * 6$  ✓**

The partial products you would calculate include  $30 * 50$ ,  $30 * 6$ ,  $4 * 50$ , and  $4 * 6$ .

**Describe how you would estimate the product of 45 and 67 by rounding to the nearest ten.**

**To estimate the product, round 45 to 50 and 67 to 70, then multiply 50 by 70.**

**Which of the following is the correct product of 23 and 45 using the distributive property?**

**undefined. A) 1035 ✓**

undefined. B) 1150

undefined. C) 945

undefined. D) 1015

The correct product of 23 and 45 using the distributive property is 1035.

**Apply the distributive property to find the product of 36 and 29. Show your work.**

**To find the product, break down 36 into 30 and 6, and 29 into 20 and 9, then calculate the partial products.**

### Part 3: Analysis, Evaluation, and Creation

---

**Which part of the multiplication process ensures accuracy in the final product?**

undefined. A) Estimation

undefined. B) Decomposition

**undefined. C) Addition of partial products ✓**

undefined. D) Direct multiplication

The addition of partial products ensures accuracy in the final product.

**Analyze the errors in the following multiplication:  $47 * 32 = 1504$ . Which steps might have been incorrect? (Select all that apply)**

**undefined. A) Incorrect decomposition ✓**

**undefined. B) Incorrect partial product calculation ✓**

**undefined. C) Incorrect addition of partial products ✓**

undefined. D) Incorrect estimation

The errors could be due to incorrect decomposition, incorrect partial product calculation, or incorrect addition of partial products.

**Analyze the process of multiplying 58 by 76 and identify potential areas where errors could occur.**

**Potential areas for errors include incorrect decomposition, miscalculating partial products, and mistakes in adding the partial products.**

**Evaluate the following statement: "Rounding both numbers to the nearest ten always gives the exact product." Is this statement true or false?**

undefined. A) True

**undefined. B) False ✓**

undefined. C) Sometimes true

undefined. D) Always true

The statement is false; rounding can lead to an estimate that is not the exact product.

**Create a real-world scenario where multiplying two-digit numbers is necessary. Which of the following could be valid scenarios? (Select all that apply)**

**undefined. A) Calculating the area of a rectangular garden ✓**

**undefined. B) Determining the total cost of items in a bulk purchase ✓**

**undefined. C) Estimating the distance traveled by a car ✓**

undefined. D) Measuring the volume of a liquid

Valid scenarios include calculating the area of a rectangular garden, determining the total cost of items in a bulk purchase, and estimating the distance traveled by a car.

**Propose a method to verify the accuracy of your multiplication result without using a calculator.**

**One method is to use estimation to check if the product is reasonable or to reverse the multiplication by dividing.**

**Synthesize a strategy to teach a younger student how to multiply two-digit numbers using the distributive property. List the key steps.**

1. What is the first step?

**Explain tens and ones.**

2. What is the second step?

**Demonstrate decomposition.**

3. What is the third step?

**Practice with examples.**

Key steps include explaining the concept of tens and ones, demonstrating decomposition, and practicing with examples.
