## Part 1: Building a Foundation

---

**What is the formula for calculating gravitational potential energy?**

undefined. A)  $PE = mv^2$

**undefined. B)  $PE = mgh$  ✓**

undefined. C)  $PE = 1/2 mv^2$

undefined. D)  $PE = mg/v$

The correct formula for gravitational potential energy is  $PE = mgh$ .

**Which of the following factors affect the gravitational potential energy of an object?**

**undefined. A) Mass ✓**

**undefined. B) Height ✓**

undefined. C) Velocity

**undefined. D) Gravitational pull ✓**

Mass, height, and gravitational pull affect gravitational potential energy.

**Explain in your own words what kinetic energy is and how it differs from potential energy.**

**Kinetic energy is the energy of motion, while potential energy is stored energy based on position.**

**List the two main types of potential energy and provide a brief description of each.**

1. Gravitational Potential Energy

**Energy stored due to an object's height above the ground.**

2. Elastic Potential Energy

**Energy stored in objects that can be stretched or compressed.**

The two main types of potential energy are gravitational potential energy and elastic potential energy.

## Part 2: Understanding and Interpretation

---

**If an object is lifted to a higher shelf, what happens to its potential energy?**

undefined. A) It decreases.

undefined. B) It remains the same.

**undefined. C) It increases. ✓**

undefined. D) It converts to kinetic energy.

The potential energy increases as the object is lifted to a higher position.

**Which scenarios demonstrate the conversion of potential energy to kinetic energy?**

**undefined. A) A ball rolling down a hill ✓**

**undefined. B) A compressed spring releasing ✓**

undefined. C) A car parked on a hill

undefined. D) A book sitting on a table

A ball rolling down a hill and a compressed spring releasing both demonstrate this conversion.

**Describe a real-world example where kinetic energy is transformed into potential energy.**

**An example is a roller coaster car climbing a hill, where kinetic energy is converted to potential energy.**

## Part 3: Application and Analysis

---

**A 2 kg object is dropped from a height of 10 meters. What is its potential energy at the top? (Use  $g = 9.8 \text{ m/s}^2$ )**

undefined. A) 19.6 J

undefined. B) 98 J

**undefined. C) 196 J ✓**

undefined. D) 20 J

The potential energy at the top is 196 J.

**Which of the following changes will increase the kinetic energy of a moving car?**

undefined. A) Increasing its mass

**undefined. B) Increasing its velocity ✓**

undefined. C) Decreasing its height

undefined. D) Decreasing its mass

Increasing its velocity will increase the kinetic energy of the car.

**A roller coaster car at the top of a hill has 5000 J of potential energy. As it descends, what happens to this energy? Explain the energy transformation process.**

**As the roller coaster descends, potential energy is converted into kinetic energy, increasing its speed.**

**If two objects have the same mass but different velocities, which object has more kinetic energy?**

**undefined. A) The object with the higher velocity ✓**

undefined. B) The object with the lower velocity

undefined. C) Both have the same kinetic energy

undefined. D) It depends on their potential energy

The object with the higher velocity has more kinetic energy.

**Analyze the following situations and identify which involve energy transformation.**

**undefined. A) A pendulum swinging ✓**

**undefined. B) A book falling off a shelf ✓**

undefined. C) A stationary car

undefined. D) A compressed spring held in place

A pendulum swinging and a book falling off a shelf involve energy transformation.

**Analyze how the conservation of energy principle applies to a pendulum in motion. Discuss the energy transformations that occur.**

**As the pendulum swings, potential energy is converted to kinetic energy and vice versa, demonstrating energy conservation.**

## Part 4: Evaluation and Creation

---

**Which statement best evaluates the relationship between mass and kinetic energy?**

undefined. A) Kinetic energy is independent of mass.

undefined. B) Kinetic energy decreases as mass increases.

undefined. C) Kinetic energy increases linearly with mass.

**undefined. D) Kinetic energy is directly proportional to mass. ✓**

Kinetic energy is directly proportional to mass.

**Evaluate the following statements and select those that correctly describe energy conservation.**

undefined. A) Energy can be created in a closed system.

**undefined. B) Energy can be transformed from one form to another. ✓**

**undefined. C) Total energy in a closed system remains constant. ✓**

undefined. D) Energy can be destroyed in a closed system.

Energy can be transformed from one form to another, and total energy in a closed system remains constant.

**Design an experiment to demonstrate the conversion of potential energy to kinetic energy using household items. Describe the setup, procedure, and expected outcomes.**

**An example experiment could involve dropping a ball from a height to show the conversion of potential energy to kinetic energy.**
