Part 1: Building a Foundation

What is the general form of a quadratic equation?

undefined. A) $ax + b = 0$

undefined. B) $ax^2 + bx + c = 0$ ✓

undefined. C) $ax^2 + b = 0$

undefined. D) $ax^2 + bx = 0$

The general form of a quadratic equation is $ax^2 + bx + c = 0$.

Which of the following are methods to solve quadratic equations? (Select all that apply)

undefined. A) Factoring ✓

undefined. B) Graphin ✓

undefined. C) Completing the Square ✓

undefined. D) Using the Pythagorean Theorem

Factoring, graphin, and completing the square are methods to solve quadratic equations.

Explain what the discriminant of a quadratic equation is and how it affects the nature of the roots.

The discriminant is $b^2 - 4ac$ and determines the nature of the roots: two distinct real roots, one real root, or two complex roots.

List the key features of a quadratic function's graph.

1. What is the vertex?

The highest or lowest point of the parabola.

2. What is the axis of symmetry?

The vertical line that divides the parabola into two mirror images.

3. What are the intercepts?

The points where the graph intersects the x-axis and y-axis.

Key features include the vertex, axis of symmetry, direction of opening, and intercepts.

Part 2: Comprehension and Application

What does the axis of symmetry of a quadratic function represent?

undefined. A) The point where the graph intersects the y-axis

undefined. **B) The vertical line that divides the parabola into two mirror images ✓**

undefined. C) The highest or lowest point on the graph

undefined. D) The horizontal line that the graph approaches but never touches

The axis of symmetry is the vertical line that divides the parabola into two mirror images.

Which of the following statements about the vertex of a quadratic function are true? (Select all that apply)

undefined. **A) It is the maximum or minimum point of the parabola. ✓**

undefined. B) It is always located at the origin.

undefined. **C) Its x-coordinate is given by $-b/(2a)$. ✓**

undefined. **D) It is the point where the parabola changes direction. ✓**

The vertex is the maximum or minimum point and its x-coordinate is given by $-b/(2a)$.

Given the quadratic equation representing the height of a projectile, describe how you would determine the maximum height reached by the projectile.

To determine the maximum height, find the vertex of the quadratic equation, which gives the maximum value of height.

In a real-world scenario, which of the following could be modeled by a quadratic equation? (Select all that apply)

undefined. **A) The trajectory of a basketball shot ✓**

undefined. B) The growth of a bank account with compound interest

undefined. C) The area of a square as a function of its side length

undefined. D) The depreciation of a car's value over time ✓

The trajectory of a basketball shot and the depreciation of a car's value can be modeled by quadratic equations.

Part 3: Analysis, Evaluation, and Creation

If the discriminant of a quadratic equation is zero, what can be concluded about the roots?

undefined. A) There are two distinct real roots.

undefined. B) There is one real root. ✓

undefined. C) There are two complex roots.

undefined. D) There are no roots.

If the discriminant is zero, there is one real root.

Analyze the following quadratic equation: $x^2 - 4x + 4 = 0$. Which statements are true? (Select all that apply)

undefined. A) The equation can be factored as $(x - 2)^2 = 0$. ✓

undefined. B) The vertex of the parabola is at $(2, 0)$. ✓

undefined. C) The parabola opens downwards.

undefined. D) The roots are real and equal. ✓

The equation can be factored as $(x - 2)^2 = 0$, and the vertex is at $(2, 0)$.

Explain how you would use the method of completing the square to solve the quadratic equation $x^2 + 6x + 5 = 0$.

To complete the square, rearrange the equation, find the value to complete the square, and solve for x.

Which of the following scenarios would not be appropriately modeled by a quadratic equation?

undefined. A) The height of a thrown ball over time

undefined. B) The area of a rectangle as a function of its length ✓

undefined. C) The path of a satellite orbiting Earth

undefined. D) The profit from selling x units of a product, where profit is a quadratic function of x

The area of a rectangle as a function of its length is linear, not quadratic.

Create a real-world problem that can be modeled by a quadratic equation. Describe the scenario and formulate the equation.

A real-world problem could involve the height of a ball thrown into the air, modeled by a quadratic equation.
