### Part 1: Building a Foundation

---

**Which of the following states of matter has a definite shape and volume?**

undefined. **A) Solid** ✓

undefined. B) Liquid

undefined. C) Gas

undefined. D) Plasma

The correct answer is A) Solid, as solids have a definite shape and volume.

**Which of the following are characteristics of gases? (Select all that apply)**

undefined. A) Definite shape

undefined. **B) No definite volume** ✓

undefined. **C) Particles move freely** ✓

undefined. **D) Highly compressible** ✓

The correct answers are B) No definite volume, C) Particles move freely, and D) Highly compressible.

**Describe the arrangement of particles in a solid.**

**In a solid, particles are closely packed together in a fixed arrangement, vibrating in place.**

**List two examples of liquids and two examples of gases.**

1. Example of liquid 1

**Water**

2. Example of liquid 2

**Oil**

3. Example of gas 1

**Oxygen**

4. Example of gas 2

**Carbon Dioxide**

Examples of liquids include water and oil; examples of gases include oxygen and carbon dioxide.

**What process describes the change from a liquid to a gas?**

undefined. A) Freezing

undefined. B) Condensation

**undefined. C) Vaporization ✓**

undefined. D) Sublimation

The correct answer is C) Vaporization, which is the process of a liquid turning into a gas.

## **Part 2: Comprehension and Application**

---

**Which factor primarily affects the state change from liquid to solid?**

undefined. A) Pressure

**undefined. B) Temperature ✓**

undefined. C) Volume

undefined. D) Density

The correct answer is B) Temperature, as lowering the temperature causes a liquid to solidify.

**Which of the following statements are true about liquids? (Select all that apply)**

undefined. A) They have a definite shape.

**undefined. B) They are slightly compressible. ✓**

**undefined. C) Their particles can slide past each other. ✓**

**undefined. D) They have a definite volume. ✓**

The correct answers are B) They are slightly compressible, C) Their particles can slide past each other, and D) They have a definite volume.

**Explain why gases are compressible while solids are not.**

**Gases are compressible because their particles are far apart and can be pushed closer together, while solids have tightly packed particles that cannot be compressed.**

**If you increase the temperature of a solid, what is the most likely change of state that will occur?**

undefined. A) Freezing

**undefined. B) Melting ✓**

undefined. C) Condensation

undefined. D) Deposition

The correct answer is B) Melting, as increasing temperature causes solids to change to liquids.

**In which scenarios would you expect condensation to occur? (Select all that apply)**

**undefined. A) Cooling a gas ✓**

undefined. B) Heating a liquid

**undefined. C) Decreasing pressure on a gas ✓**

undefined. D) Increasing pressure on a gas

The correct answers are A) Cooling a gas and C) Decreasing pressure on a gas.

**Describe a real-world scenario where sublimation occurs and explain the process.**

**Sublimation occurs when a solid turns directly into a gas without becoming a liquid, such as dry ice turning into carbon dioxide gas.**

### **Part 3: Analysis, Evaluation, and Creation**

---

**Which state of matter is most affected by changes in pressure?**

undefined. A) Solid

undefined. B) Liquid

**undefined. C) Gas ✓**

undefined. D) Plasma

The correct answer is C) Gas, as gases are highly compressible and their volume changes significantly with pressure.

**Analyze the following situations and determine which involve a change of state. (Select all that apply)**

undefined. **A) Ice melting in a drink ✓**

undefined. **B) Water boiling on a stove ✓**

undefined. **C) Steam condensing on a mirror ✓**

undefined. D) A rock being crushed

The correct answers are A) Ice melting in a drink, B) Water boiling on a stove, and C) Steam condensing on a mirror.

**Compare and contrast the particle movement in liquids and gases.**

**In liquids, particles are close together and can slide past each other, while in gases, particles are far apart and move freely.**

**Which of the following scenarios would most likely result in deposition?**

undefined. A) Water vapor in a warm room

undefined. **B) Frost forming on a cold window ✓**

undefined. C) Ice melting in the sun

undefined. D) A puddles evaporating

The correct answer is B) Frost forming on a cold window, as deposition occurs when a gas turns directly into a solid.

**Evaluate the following statements and select those that correctly describe changes of state. (Select all that apply)**

undefined. **A) Boiling is a form of vaporization. ✓**

undefined. **B) Freezing is the opposite of melting. ✓**

undefined. C) Sublimation occurs when a gas turns into a solid.

undefined. D) Condensation is the process of a liquid becoming a gas.

The correct answers are A) Boiling is a form of vaporization and B) Freezing is the opposite of melting.

**Design an experiment to demonstrate the process of condensation. Describe the materials needed, the procedure, and the expected outcome.**

**An experiment could involve cooling a glass with ice water to show condensation forming on the outside of the glass.**
