Part 1: Building a Foundation

What is the formula for calculating speed?

undefined. Speed = Distance \times Time

undefined. **Speed = Distance / Time** ✓

undefined. Speed = Time / Distance

undefined. Speed = Distance + Time

The correct formula for calculating speed is Speed = Distance / Time.

Which of the following are units of speed? (Select all that apply)

undefined. **Meters per second (m/s)** ✓

undefined. **Kilometers per hour (km/h)** ✓

undefined. Seconds (s)

undefined. **Miles per hour (mph)** ✓

Units of speed include Meters per second (m/s), Kilometers per hour (km/h), and Miles per hour (mph).

Explain the difference between speed and velocity in your own words.

Speed is a scalar quantity that refers to how fast an object is moving, while velocity is a vector quantity that includes both speed and direction.

List two examples of scalar quantities and two examples of vector quantities.

1. Scalar Quantity 1

Temperature

2. Scalar Quantity 2

Mass

3. Vector Quantity 1

Displacement

4. Vector Quantity 2

Force

Examples of scalar quantities include temperature and mass, while examples of vector quantities include displacement and force.

Part 2: Comprehension and Application

If a car travels 150 kilometers north in 3 hours, what is its velocity?

undefined. 50 km/h

undefined. 50 km/h north ✓

undefined. 150 km/h

undefined. 150 km/h north

The velocity of the car is 50 km/h north.

Which of the following statements about acceleration are true? (Select all that apply)

undefined. Acceleration can be negative. ✓**undefined. Acceleration is the rate of change of speed. ✓**

undefined. Acceleration is a scalar quantity.

undefined. Acceleration is measured in meters per second squared (m/s^2). ✓

True statements include that acceleration can be negative, it is the rate of change of speed, and it is measured in meters per second squared (m/s^2).

Describe a real-world scenario where understanding velocity is more important than speed.

In scenarios like navigation or sports, understanding velocity is crucial as it includes direction, which can affect outcomes.

A cyclist increases her speed from 5 m/s to 15 m/s in 5 seconds. What is her acceleration?

undefined. 2 m/s^2 ✓

undefined. 3 m/s²

undefined. 5 m/s²

undefined. 10 m/s²

The acceleration of the cyclist is 2 m/s².

Which scenarios demonstrate acceleration? (Select all that apply)

undefined. A car maintaining a constant speed of 60 km/h.

undefined. A train slowing down as it approaches a station. ✓

undefined. A ball rolling down a hill and gaining speed. ✓

undefined. A runner maintaining a steady pace.

Scenarios that demonstrate acceleration include a train slowing down and a ball rolling down a hill.

Calculate the speed of a runner who covers 400 meters in 50 seconds. Show your work.

The speed of the runner is 8 m/s, calculated by dividing 400 meters by 50 seconds.

Part 3: Analysis, Evaluation, and Creation

Which of the following best describes the relationship between speed, velocity, and acceleration?

undefined. Speed and velocity are the same; acceleration is unrelated.

undefined. Speed is a scalar, velocity is a vector, and acceleration is the rate of change of velocity. ✓

undefined. Velocity is the rate of change of speed; acceleration is the rate of change of velocity.

undefined. Speed and acceleration are vectors; velocity is a scalar.

Speed is a scalar, velocity is a vector, and acceleration is the rate of change of velocity.

Analyze the following situations and identify which involve a change in velocity. (Select all that apply)

undefined. A car traveling east at a constant speed.

undefined. A plane taking off and climbing at an angle. ✓

undefined. A boat moving in a circular path at constant speed. ✓

undefined. A cyclist stopping at a traffic light. ✓

Situations that involve a change in velocity include a plane taking off and climbing at an angle, and a cyclist stopping at a traffic light.

Discuss how the concepts of speed, velocity, and acceleration are interconnected in the context of a roller coaster ride.

In a roller coaster ride, speed, velocity, and acceleration are interconnected as the coaster changes speed and direction, creating thrilling experiences.

Which situation would require the most precise measurement of acceleration?

undefined. A marathon runner's pace.

undefined. A spacecraft launching into orbit. ✓

undefined. A cyclist on a flat road.

undefined. A car driving on a highway.

A spacecraft launching into orbit would require the most precise measurement of acceleration.

Evaluate the following statements and identify which are correct regarding the impact of acceleration on motion. (Select all that apply)

undefined. Acceleration can change the direction of motion. ✓

undefined. Constant acceleration always increases speed.

undefined. Negative acceleration can stop an object. ✓

undefined. Acceleration is always in the direction of motion.

Correct statements include that acceleration can change the direction of motion, and negative acceleration can stop an object.

Design an experiment to measure the acceleration of a toy car on a ramp. Describe the materials you would use, the procedure, and how you would calculate the acceleration.

An experiment could involve using a toy car, a ramp, a stopwatch, and a measuring tape to measure the time and distance, then calculate acceleration using the formula.
