Part 1: Building a Foundation

What is the primary function of the nucleus in a cell?

undefined. Energy production

undefined. Protein synthesis

undefined. Genetic material storage ✓

undefined. Lipid synthesis

The primary function of the nucleus is to store genetic material.

Which of the following organelles are involved in protein synthesis? (Select all that apply)

undefined. Ribosomes ✓

undefined. Golgi Apparatus ✓

undefined. Rough Endoplasmic Reticulum ✓

undefined. Lysosomes

Ribosomes, Rough Endoplasmic Reticulum, and Golgi Apparatus are involved in protein synthesis.

Describe the role of the cell membrane in maintaining cellular homeostasis.

The cell membrane regulates the movement of substances in and out of the cell, maintaining a stable internal environment.

List two organelles found only in plant cells and briefly describe their functions.

1. Organelles: Chloroplasts

Function: Photosynthesis

2. Organelles: Cell wall

Function: Provides structure and support

Chloroplasts (involved in photosynthesis) and cell walls (provide structure and support) are unique to plant cells.

Part 2: Understanding and Interpretation

Which organelle is responsible for detoxifying harmful substances in the cell?

undefined. Lysosomes

undefined. Peroxisomes ✓

undefined. Smooth Endoplasmic Reticulum

undefined. Golgi Apparatus

The peroxisomes are responsible for detoxifying harmful substances.

The Golgi apparatus is involved in which of the following processes? (Select all that apply)

undefined. Modifying proteins ✓

undefined. Synthesizing lipids ✓

undefined. Packaging proteins for secretion ✓

undefined. Photosynthesis

The Golgi apparatus modifies proteins, synthesizes lipids, and packages proteins for secretion.

Explain how the structure of the rough endoplasmic reticulum relates to its function in the cell.

The rough endoplasmic reticulum has ribosomes on its surface, which allows it to synthesize proteins effectively.

Part 3: Application and Analysis

If a cell is unable to produce ATP efficiently, which organelle is most likely malfunctionING?

undefined. Chloroplast

undefined. mitochondria ✓

undefined. Nucleus

undefined. Ribosome

The mitochondria are most likely malfunctionING if a cell cannot produce ATP efficiently.

A scientist discovers a new cell type that can detoxify chemicals very efficiently. Which organelles might be particularly abundant in this cell? (Select all that apply)

undefined. Lysosomes

undefined. Peroxisomes ✓

undefined. Smooth Endoplasmic Reticulum ✓

undefined. Golgi Apparatus

Peroxisomes and Smooth Endoplasmic Reticulum are likely to be abundant in a cell that detoxifies chemicals efficiently.

Describe a scenario in which the malfunction of lysosomes could lead to cellular damage.

If lysosomes malfunction, waste materials can accumulate, leading to cellular damage and disease.

Part 4: Evaluation and Creation

How does the presence of a cell wall affect the overall function of plant cells compared to animal cells?

undefined. Provides structural support and protection ✓

undefined. Increases flexibility

undefined. Enhances energy production

undefined. Facilitates rapid movement

The cell wall provides structural support and protection, which is crucial for plant cells.

Analyze the relationship between the cytoskeleton and cell movement. Which components are involved? (Select all that apply)

undefined. Microfilaments ✓

undefined. Intermediate filaments ✓

undefined. Actin filaments ✓

undefined. Ribosomes

Microfilaments, microvilli, and intermediate filaments are involved in cell movement.

Compare and contrast the roles of the smooth and rough endoplasmic reticulum in a cell.

The rough ER is involved in protein synthesis, while the smooth ER is involved in lipid synthesis and detoxification.

Which organelle would you consider most critical for a cell's survival, and why?

undefined. Nucleus

undefined. mitochondria ✓

undefined. Ribosome

undefined. Golgi Apparatus

The mitochondria are often considered critical for a cell's survival due to their role in ATP production.

Evaluate the impact of a non-functional Golgi apparatus on cellular processes. Which of the following would be affected? (Select all that apply)

undefined. Protein modification ✓

undefined. Lipid synthesis

undefined. Protein packaging ✓

undefined. Photosynthesis

A non-functional Golgi apparatus would affect protein modification, packaging, and lipid synthesis.

Design a hypothetical experiment to test the effect of temperature on the efficiency of chloroplasts in photosynthesis. Include your hypothesis, variables, and method.

The experiment should outline how temperature affects chloroplast function and photosynthesis rates.
